

--McDonald's Sales Performance Dashboard Story--

"This project was designed to demonstrate how business data can be transformed into a dashboard that supports strategic decision-making in the restaurant industry. Instead of manually reviewing spreadsheets, managers can monitor key performance indicators and identify areas for improvement from a single interactive dashboard."

I worked with a dataset containing information on sales, profit, customer counts, customer satisfaction metrics, monthly performance, and country-wise sales. My first step was to clean and validate the data by checking for missing values, ensuring consistent formats, and verifying calculations.

Next, I identified the business questions that restaurant management would typically ask:

- How much revenue and profit are we generating?
- How many customers are we serving?
- Are sales improving year over year?
- Which countries contribute the most revenue?
- How satisfied are our customers?
- Which operational areas need improvement?

To answer these questions, I created KPI cards for **Total Sales (\$2,544)**, **Profit (\$890)**, and **Customers (87)**, giving management a quick overview of business performance.

I built a **Sales Trend chart** comparing 2025 and 2026. The analysis showed that while sales fluctuated during the middle of the year, 2026 experienced stronger growth toward the end of the year. This insight can help management plan seasonal promotions and staffing requirements.

To evaluate customer experience, I developed a **Customer Satisfaction Radar Chart**. The analysis revealed excellent scores in **Availability (95%)**, **Hygiene (93%)**, and **Food Quality (86%)**, showing that operational standards are strong. However, **Service (53%)** and **Speed (54%)** scored noticeably lower, indicating opportunities to improve customer service efficiency and reduce waiting times.

I also analyzed **country-wise sales**, where **Argentina** emerged as the highest-performing market, followed by **Brazil** and **Ecuador**. This type of analysis can support regional marketing strategies and resource allocation.

This project strengthened my technical skills in **Microsoft Excel, Pivot Tables, Pivot Charts, dashboard design, and business analytics**. More importantly, it improved my ability to communicate data through storytelling. Rather than simply presenting numbers, I focused on explaining what the data means, why it matters to the business, and what actions management could take based on the insights. That ability to connect analysis with business decisions is what I consider the biggest outcome of this project.
